True radix sorting

Terdiman, 2000
http://codercorner.com/RadixSortRevisited.htm

Herf, 2001

http://stereopsis.com/radix.html

Dowle & Srinivasan, 2015

http://user2015.math.aau.dk/presentations/234.pdf

Now included in R itself thanks to time and skill of Michael Lawrence.

But

Single threaded

Single node

Limited to 2 billion rows (2^31)

=> H2O

Every step has now been parallelized and distributed

data.table join

- Find order of the left join columns
- Find order of the right join columns
- Binary merge the two sorted indexes

- No hash table at all
- Fast ordered joins; e.g. rolling forwards, backwards, nearest and limited staleness

Further info

- DataCamp course

Cardinality

Not just the number of rows, but what's in the rows

A 10 billion row file could contain :

- 500 stock tickers (low cardinality)
- Millions of people (medium cardinality)
- Billions of devices (high cardinality)

Create some test data

```
#!/usr/bin/awk -f
nrow = ARGV[2]
while(i<nrow)
{
    printf "%d,%d\n",
        rand()*nrow,
        rand()*nrow*2 - nrow;
    i++;
}
```

1e6 rows; 14MB

```
