Data Science Milan
Politecnico di Milano
10th October, 2016

Agenda

- First Talk (25 mins)
 - About H2O.ai
 - Demo
 - A Simple Classification Task
 - H2O's Web Interface
 - Why H2O?
 - Our Community
 - Our Customers
 - What's Next?
 - New H2O Features
- Second Talk (25 mins)
 - H2O for IoT
 - Predictive Maintenance
 - Anomaly Detection
 - H2O's R Interface
- Third Talk (25 mins)
 - Deep Water
 - Demo
 - H2O + mxnet on GPU
 - H2O's Python Interface

Use Case 1

Predictive Maintenance

Data for Use Case 1: SECOM

UCI

Machine Learning Repository

Center for Machine Learning and Intelligent Systems

SECOM Data Set

Download: [Data Folder](#), [Data Set Description](#)

Abstract: Data from a semi-conductor manufacturing process

Data Set Characteristics:	Multivariate	Number of Instances:	1567	Area:	Computer
Attribute Characteristics:	Real	Number of Attributes:	591	Date Donated	2008-11-19
Associated Tasks:	Classification, Causal-Discovery	Missing Values?	Yes	Number of Web Hits:	37895

Source:

<https://archive.ics.uci.edu/ml/datasets/SECOM>

Authors: Michael McCann, Adrian Johnston

Data Set Information:

A complex modern semi-conductor manufacturing process is normally under consistent surveillance via the monitoring of signals/variables collected from sensors and or process measurement points. However, not all of these signals are equally valuable in a specific monitoring system. The measured signals contain a combination of useful information, irrelevant information as well as noise. It is often the case that useful information is buried in the latter two. Engineers typically have a much larger number of signals than are actually required. If we consider each type of signal as a feature, then feature selection may be applied to identify the most relevant signals. The Process Engineers may then use these signals to determine key factors contributing to yield excursions downstream in the process. This will enable an increase in process throughput, decreased time to learning and reduce the per unit production costs.

To enhance current business improvement techniques the application of feature selection as an intelligent systems technique is being investigated.

The dataset presented in this case represents a selection of such features where each example represents a single production entity with associated measured features and the labels represent a simple pass/fail yield for in house line testing, figure 2, and associated date time stamp. Where -1 corresponds to a pass and 1 corresponds to a fail and the data time stamp is for that specific test point.

Using feature selection techniques it is desired to rank features according to their impact on the overall yield for the product, causal relationships may also be considered with a view to identifying the key features.

Results may be submitted in terms of feature relevance for predictability using error rates as our evaluation metrics. It is suggested that cross validation be applied to generate these results. Some baseline results are shown below for basic feature selection techniques using a simple kernel ridge classifier and 10 fold cross validation.

Baseline Results: Pre-processing objects were applied to the dataset simply to standardize the data and remove the constant features and then a number of different feature selection objects selecting 40 highest ranked features were applied with a simple classifier to achieve some initial results. 10 fold cross validation was used and the balanced error rate (*BER) generated as our initial performance metric to help investigate this dataset.

SECOM Dataset: 1567 examples 591 features, 104 fails

FSmethod (40 features) BER % True + % True - %
S2N (signal to noise) 34.5 +-2.6 57.8 +-5.3 73.1 +-2.1
Ttest 33.7 +-2.1 59.6 +-4.7 73.0 +-1.8
Relief 40.1 +-2.8 48.3 +-5.9 71.6 +-3.2
Pearson 34.1 +-2.0 57.4 +-4.3 74.4 +-4.9
Ftest 33.5 +-2.2 59.1 +-4.8 73.8 +-1.8
Gram Schmidt 35.6 +-2.4 51.2 +-11.8 77.5 +-2.3

We want to predict fails in the future.

The ML Problem – Pass/Fail

- Inputs
 - 591 features
- Output
 - Classification
 - -1 = pass
 - 1 = fail
- Size: 1567 Samples

Response: Classification -1 (Pass) or 1 (Fail)

Use Case 1: Predictive Maintenance

Step 1: R Packages

step_01_install_packages.R

Package 'h2o'

```
1 # -----
2 # Step 1: Install R Packages for Workshop
3 # -----
4
5 # -----
6 # Install "h2o" for machine learning
7 # Reference: http://www.h2o.ai/download/h2o/r
8 # -----
9
10 # The following two commands remove any previously installed H2O packages for R.
11 if ("package:h2o" %in% search()) { detach("package:h2o", unload=TRUE) }
12 if ("h2o" %in% rownames(installed.packages())) { remove.packages("h2o") }
13
14 # Next, we download packages that H2O depends on.
15 pkgs <- c("methods", "statmod", "stats", "graphics", "RCurl", "jsonlite", "tools", "utils")
16 for (pkg in pkgs) {
17   if (! (pkg %in% rownames(installed.packages()))) { install.packages(pkg) }
18 }
19
20 # Now we download, install and initialize the H2O package for R.
21 install.packages("h2o",
22                 type="source",
23                 repos=(c("http://h2o-release.s3.amazonaws.com/h2o/rel-turing/7/R")))
24
25 # Quick test
26 suppressPackageStartupMessages(library(h2o))
27 h2o.init(nthreads = -1)
```

```
> suppressPackageStartupMessages(library(h2o))
> h2o.init(nthreads = -1)
Connection successful!
```

R is connected to the H2O cluster:

H2O cluster uptime:	1 minutes 891 milliseconds
H2O cluster version:	3.10.0.7
H2O cluster version age:	6 days
H2O cluster name:	H2O_started_from_R_jofaichow_ayn543
H2O cluster total nodes:	1
H2O cluster total memory:	3.28 GB
H2O cluster total cores:	8
H2O cluster allowed cores:	8
H2O cluster healthy:	TRUE
H2O Connection ip:	localhost
H2O Connection port:	54321
H2O Connection proxy:	NA
R Version:	R version 3.3.0 (2016-05-03)

Use Case 1: Predictive Maintenance

Step 2: Exploratory Analysis

step_02_exploratory_analysis.R

Importing SECOM data

```
1- # -----
2 # Step 2: Data Exploration
3- # -----
4
5 # Start and connect to a local H2O cluster
6 library(h2o)
7 h2o.init(nthreads = -1)
8
9 # Import data from a local CSV file
10 # Source: https://archive.ics.uci.edu/ml/machine-learning-databases/secom/
11 secom <- h2o.importFile(path = "./data/secom.csv", destination_frame = "secom")
12
13 # (Optional) Demo - Importing files using URLs
14 secom <- h2o.importFile(
15   path = "https://github.com/woobe/H2O_London_Workshop/raw/master/data/secom.csv",
16   destination_frame = "secom")
17
18 # (Optional) Demo - Converting R data frame into H2O data frame
19 hdf_iris <- as.h2o(iris)
20
21 # (Optional) Turning off progress bar in R
22 h2o.no_progress()
```

Optional (different ways to import data)

```
java version "1.8.0_72"
Java(TM) SE Runtime Environment (build 1.8.0_72-b15)
Java HotSpot(TM) 64-Bit Server VM (build 25.72-b15, mixed mode)
```

Starting H2O JVM and connecting: ... Connection successful!

R is connected to the H2O cluster:

H2O cluster uptime:	2 seconds 721 milliseconds
H2O cluster version:	3.10.0.7
H2O cluster version age:	7 days, 10 hours and 4 minutes
H2O cluster name:	H2O_started_from_R_jofaichow_cow128
H2O cluster total nodes:	1
H2O cluster total memory:	3.56 GB
H2O cluster total cores:	8
H2O cluster allowed cores:	8
H2O cluster healthy:	TRUE
H2O Connection ip:	localhost
H2O Connection port:	54321
H2O Connection proxy:	NA
R Version:	R version 3.3.0 (2016-05-03)

```
>
> # Import data from a local CSV file
> # Source: https://archive.ics.uci.edu/ml/machine-learning-databases/secom/
> secom <- h2o.importFile(path = "./data/secom.csv", destination_frame = "secom")
|=====| 100%
```

step_02_exploratory_analysis.R

Basic exploratory analysis

```
25 # Basic exploratory analysis
26 print(dim(secom)) # 1567 x 599
27 print(summary(secom$Classification))
28 # alternatively, use H2O flow to look at data (localhost:54321)
29
30 # Convert Classification to factor
31 secom$Classification <- as.factor(secom$Classification)
32 print(summary(secom$Classification))
```

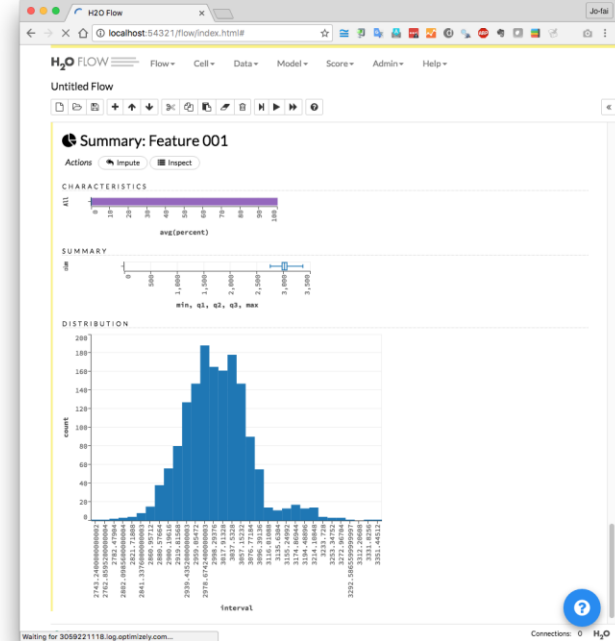

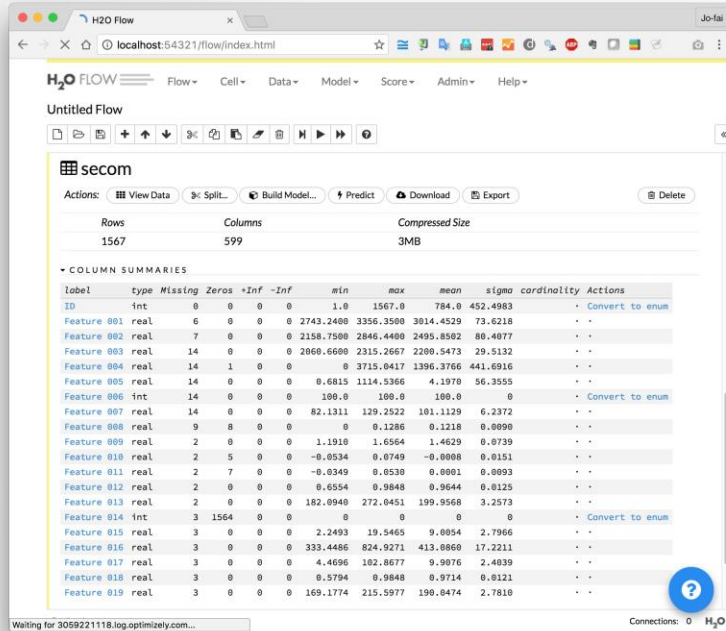

Convert -1 and 1 to categorical value

```
> # Basic exploratory analysis
> print(dim(secom)) # 1567 x 599
[1] 1567 599
> print(summary(secom$Classification))
Classification
Min.    :-1.0000
1st Qu. :-1.0000
Median :-1.0000
Mean    :-0.8673
3rd Qu. :-1.0000
Max.     : 1.0000
```

```
> # Convert Classification to factor
> secom$Classification <- as.factor(secom$Classification)
> print(summary(secom$Classification))
Classification
-1:1463
1 : 104
```

Note: Imbalance dataset (only 104 fails)

Use H2O Flow (localhost:54321)

Use Case 1: Predictive Maintenance

Step 3: Building & Evaluating Models

step_03_basic_models.R

Define features & target

```
5 ~ # -----
6 # Loading data (same as previous steps)
7 ~ # -----
8
9 # Start and connect to a local H2O cluster
10 library(h2o)
11 h2o.init(nthreads = -1)
12
13 # Import data from a local CSV file
14 # Source: https://archive.ics.uci.edu/ml/machine-learning-databases/secom/
15 secom <- h2o.importFile(path = "./data/secom.csv", destination_frame = "secom")
16
17 # Convert Classification to factor
18 secom$Classification <- as.factor(secom$Classification)
19
20

Advanced Procedures

- Step 4 – Manual Tuning
- Step 5 – Early Stopping
- Step 6 – Grid Search
- Step 7 – Stacking Models (“h2oEnsemble”)
- Step 8 – Saving/Loading Models
- Please try them out later (bit.ly/h2o_milan_1)

Use Case 2: Anomaly Detection

Anomaly (Outlier) Detection

- Definition

- Identification of items, events or observations which do not conform to an expected pattern or other items in a dataset.

Photo credit: www.dbta.com

- Use Cases

- Bank Fraud
- Monitoring Manufacturing Lines
- Machine Learning
 - Separate dataset and build different models
